Senior Go Backend Engineer | Blockchain | Distributed Systems | AI-Driven Systems SUMMARY

Results-oriented Senior Go Backend Engineer with 6+ years of experience designing and scaling high-load systems in the fintech and investment industry. Specialized in developing distributed microservices, REST/gRPC APIs, and event-driven architectures using Go, Kafka, and PostgreSQL. Experienced in building financial analytics tools, trading platforms, and payment integrations that meet strict performance and reliability requirements. Passionate about clean architecture, system optimization, and delivering production-grade backend solutions that power real-time financial products and drive measurable business growth. Interested in AI-driven systems (NLP, generative models, recommendation pipelines) as a complementary direction.

KEY SKILLS

Backend & Distributed Systems: Go, Kafka, gRPC/REST, Blockchain, microservices, event-driven architecture, Pub/Sub, Saga pattern, caching, high-load systems, cryptocurrency, AI
Databases: PostgreSQL, Cassandra, Redis, ClickHouse, MongoDB, NoSql, Sql
Infrastructure & DevOps: AWS, GCP, Kubernetes, Helm, Docker, Nginx, Ansible, Terraform, CI/CD (GitLab CI, TeamCity), Prometheus, Grafana, Elasticsearch, Kong API Gateway, Canary & Blue-Green Deployments, Vault, A/B testing
Programming Languages: Go, C++, Python, Java
Version Control: Git, SVN
Soft Skills: High ownership & delivery under pressure, Goal-oriented, Proactive problem-solving, Root-cause mindset, Team collaboration, Business communication
Language: English (C1)

KEY ACHIEVEMENTS

- Launched and scaled a **Digital Financial Assets (DFA)** backend platform processing 500K+ transactions in 2025 and contributing to 280 000 USD annual turnover.
- Designed high-load financial services handling up to **12K RPS**, powering core investment features (positions, transaction history, profitability calculations).
- Improved system reliability by eliminating cross-storage inconsistencies (Postgres + Cassandra) using the **Saga pattern**, preventing data loss across 3K+ client positions.
- Achieved **100× speedup** in data migration pipeline through parallelization across Kubernetes pods.
- Reduced application startup allocation costs by **5×** and memory usage by **30%** via custom in-memory cache redesign.
- Introduced performance benchmarking in production CI (Google Benchmark + TeamCity), detecting a **1.5× regression** before release and improving execution speed by ~15%.
- Delivered 12 new financial products in one year within a regulated fintech environment.

PROFESSIONAL EXPERIENCE

[EPAM](#) | Global leader in AI transformation engineering and integrated consulting

Senior Go Backend Engineer | Apr 2023 – Present

Stack: Go, Kafka, Postgres, Cassandra, Redis, ClickHouse, Kubernetes, Helm, Docker, GitLab CI/CD, REST, gRPC, A/B testing, Prometheus, Grafana

Projects: Blockchain, Cryptocurrency, Bonds and Futures, Notifications, Exchange, Data Consistency & Reliability Improvements, Performance & Infrastructure Optimization, Product Responsibility

Contributing to the development and optimization of backend services for financial analytics and transaction platforms used by enterprise fintech clients. Focused on Go-based microservices, event-driven architectures, and high-load data processing systems ensuring performance, reliability, and scalability.

- Led backend architecture and launch of a Digital Financial Assets (DFA) - a new product line based on Blockchain enabling tokenized asset operations and reporting. Enabling 500K+ transactions in 2025 and contributing ~\$280K annual turnover.
- Designed services handling up to 12K RPS for positions, profitability calculations, and transaction history.
- Eliminated cross-storage inconsistencies (PostgreSQL + Cassandra) using Saga pattern, preventing data loss across 3K+ client positions.
- Re-architected data migration pipeline (Postgres → Cassandra), achieving ~100× speedup via Kubernetes parallelization and increasing execution frequency from daily to every 5 minutes.
- Reduced application startup allocation costs by 5× and memory usage by 30% through in-memory cache redesign.
- Delivered 12+ regulated financial products (structured notes, tokenized equities, debt & crypto-based instruments) within one year.
- Own core business logic of Positions Feed (profitability, valuation, pricing) used as a data source by multiple downstream systems.

[DataArt](#) | Global software engineering firm that delivers breakthrough data, analytics, and AI platforms

Senior Go Backend Engineer | Oct 2021 – Apr 2023

Stack: Go, C++, Python, gRPC, Kubernetes, Prometheus, Grafana, Google Benchmark, TeamCity CI/CD, TF-IDF, BM25, Git, GitLab CI/CD, Windows/Linux, OpenTelemetry

- Developed and maintained document search functionality and ranking pipelines, improving retrieval speed and relevance across millions of indexed records.
- Implemented gRPC wrappers around core monolithic methods, enabling gradual transition toward microservice-oriented architecture.
- Enhanced the document relevance algorithm (TF-IDF, BM25), improving sorting accuracy and query response times by 35%.
- Optimized tracing and profiling pipelines across architectures using gperftools and perf, successfully identifying bottlenecks and reducing CPU utilization by 20%.
- Designed and deployed a benchmarking framework (Google Benchmark) integrated with TeamCity CI/CD, allowing automated performance validation and regression alerts (~1.5× deviation detection).
- Collaborated with product and QA teams to refine system architecture, improve observability, and align optimization priorities with business objectives.

DataArt | Global software engineering firm that delivers breakthrough data, analytics, and AI platforms

Full-Stack Developer | Aug 2020 – Oct 2021

Stack: Go, C++, Python, gRPC, Kubernetes, PostgreSQL, MongoDB, Prometheus, Grafana, Google Benchmark, TeamCity CI/CD, TF-IDF, BM25, Git, GitLab CI/CD, Windows/Linux, OpenTelemetry

Project: Risk analysis service for private house purchase. Reached Approximately 2,000 users in its first month after launch.

- Developed core frontend functionality including pagination logic for multi-step survey forms to improve UX and data handling.
- Implemented dynamic tooltips to enhance usability and clarify legal risk factors for end users.
- Built a PDF export feature that generated downloadable reports with users' saved responses.
- Contributed to full-stack development of an internal prototype (backend + frontend); project remained at prototype stage and was not released to production.

EDUCATION

Moscow Institute of Physics and Technology (MIPT), Moscow, Russia (2024 – 2026)

M.Sc. in Computer Science and Engineering (Informatics and Computer Engineering)

Moscow Institute of Physics and Technology (MIPT) | Moscow, Russia (2020 – 2024)

B.Sc. in Applied Mathematics

EXTRACURRICULAR ACTIVITIES

-
- **BEST Hack (Apr 2023) – 2nd place:** Built a service to streamline communication between retail clients and brokers.
 - **NESTRO Challenge (Sep 2023) – 3rd place:** Developed a data service prototype for an oil & gas company (data processing / analytics workflow).

PROJECTS

-
- **Decentralized Messenger (Golang):** Built a P2P AI messenger based on a pub/sub architecture with direct peer communication and UI client. [GitHub available.](#)
 - **Word Distance Search Application (C++):** Developed an algorithm for finding word pairs within a given distance in text; covered with automated tests (BDD). [GitHub available.](#)
 - **Telegram Channel Post Analyzer (Python):** Built a Telegram bot for classifying channel posts by negativity using text processing and Telegram Bot API. [GitHub available.](#)
